Practice School II Synopsis 2026

Design, Automation and Deployment of Retention Campaign Systems

PREPARED BY

Anwesha Mondal

2022BTech016

EXTERNAL SUPERVISOR

Ms. Vipa Jhaveri

FACULTY SUPERVISOR

Asst. Prof. Ankush Soni

Department of Computer Science & Engineering

Institute of Engineering and Technology

JK Lakshmipat University, Jaipur

Rajasthan – 302026

March,2025

1. PROBLEM / WORK DEFINITION 3
2. BACKGROUND STUDY AND THEORETICAL FOUNDATIONS 3
3. TENTATIVE WORK PLAN 4
4. TOOLS AND TECHNOLOGY REQUIRED 4

1. PROBLEM / WORK DEFINITION

In the current digital ecosystem, businesses face increasing challenges in retaining users and maintaining structured engagement across multiple communication channels. While customer acquisition drives initial growth, long-term sustainability depends on systematic retention strategies supported by automation and behavioural targeting.
During Practice School - II, my role involves contributing to the design, configuration, and deployment of automation-driven retention campaigns for multiple client brands. Rather than focusing on a single isolated project, my work spans ongoing operational responsibilities within the company's retention marketing function.
The core technical focus of my involvement includes:

- Designing structured campaign creatives
- Configuring HTML-based email templates
- Implementing segmentation logic
- Setting up trigger-based automation workflows
- Managing time-based scheduling
- Performing UTM-based performance tracking
- Deploying and validating campaigns across platforms

The objective of this engagement is to ensure technically accurate execution of retention campaigns while optimizing user engagement through structured automation systems.

2. BACKGROUND STUDY AND THEORETICAL FOUNDATIONS

The work undertaken during Practice School – II involves the application of core Computer Science principles within an automation-driven campaign management environment. The operational framework integrates system architecture design, workflow automation logic, structured data handling, and API-based communication mechanisms to enable efficient multi-channel campaign execution.

The theoretical foundations applied in this engagement include:

Workflow Automation and Control Logic
Automation systems operate using event-driven execution and conditional branching. Configuring retention workflows requires understanding sequential execution models, decision structures, and state-based logic.

Data Structuring and Segmentation
User targeting is based on structured attributes such as engagement activity, product interaction, and purchase behaviour. Implementing segmentation logic requires understanding logical filtering, attribute-based grouping, and structured data handling.

API-Based Distributed Systems
WhatsApp and email campaign delivery systems operate via backend APIs. Understanding request-response architecture, authentication models, and structured payload transmission is essential for campaign configuration and deployment.

HTML Template Structuring
Email campaign deployment requires structured HTML formatting, hyperlink embedding, media referencing, and responsive layout configuration to ensure platform compatibility.

Tracking and Attribution Mechanisms

UTM parameter integration involves structured query string manipulation and metadata tagging for campaign performance measurement.

Debugging and Validation
Campaign deployment in a live environment requires systematic debugging, workflow reconfiguration, and validation of template mappings and automation triggers.
Through this continuous professional involvement, theoretical computing principles are applied within a real-time customer engagement automation framework.

3. TENTATIVE WORK PLAN

Since the engagement is operational rather than a single project-based task, the tentative work plan focuses on progressive skill enhancement and deeper technical involvement within the retention automation function.

Phase 1: Advanced Workflow Handling
- Implement multi-step conditional automation sequences
- Improve segmentation refinement techniques
- Optimize template structuring practices

Phase 2: Performance Optimization
- Enhance tracking and attribution accuracy
- Assist in A/B testing implementation
- Analyse engagement metrics for workflow improvement

Phase 3: Independent Automation Management
- Handle complete campaign lifecycle execution independently
- Perform structured testing and validation
- Improve documentation and process efficiency

4. TOOLS AND TECHNOLOGY REQUIRED

The work requires integration of multiple automation and communication platforms, including:
- HTML (Email template structuring)
- UTM parameter generation mechanisms
- Interakt (WhatsApp automation)
- Customer.io (Workflow automation engine)
- Mailchimp and Mailjet (Email deployment systems)
- Meta Business Suite (Template registration and approval)
- Adobe Creative Cloud and Canva (Creative asset development)
- ClickUp (Workflow and task management)
